

Github issues JS

- In this task, you will be using the github api to get list of issues and display it in a pagewise manner. You will specifically be using this url for fetching issues
[https://api.github.com/repositories/1296269/issues?page=\\${pageNumberHere}&per_page=5](https://api.github.com/repositories/1296269/issues?page=${pageNumberHere}&per_page=5)
- By default you will start with page 1 when your app loads.
- This API returns a lot of data, your task is to only display issue names in an ordered list.
- Also display "Page number 1" on first page, and keep changing it depending on number of page.
- You will make 2 buttons, One button with id="load_next" which loads the next page of issues by calling the above mentioned API with the current page number + 1, replacing the currently displayed issues with new issues and also changing the "Page number 1" heading to "Page number 2".
- And the second button with id="load_prev", which goes back one page and displays the previous, page's issues and also changes the Page number heading.(Edge case hint:- you cannot go to Page number 0)

Note:- Do not change the per_page parameter in URL, you only have to display 5 issues per page.
